

USER STORIES

1. Vendor Manages Menu Item Availability (3 Story points)

As a vendor, I want to mark menu items as available or sold out so that students only see items they can actually order.

UAT 1:

Given: I am a logged-in vendor, and I have a menu item currently marked as available

When: I click "Mark as Sold Out" on that item and confirm Then: the item's availability status updates to "sold out" in the database and is reflected immediately on my menu grid

UAT 2:

Given: I am a logged-in vendor, and I have a menu item currently marked as sold out

When: I click "Mark as Available" on that item Then: the item's availability status updates to "available" in the database and students can add it to their orders again

UAT 3:

Given: I am a logged-in vendor, and I have marked one or more items as sold out

When: I refresh the page or log out and log back in Then: each item's availability status is preserved exactly as I set it and no statuses are reset to a default

UAT 4:

Given: I am a logged-in vendor, and my menu contains both available and sold-out items

When: I view my menu grid Then: sold-out items are clearly distinguished from available ones (e.g. greyed out or labelled "Sold Out") so I can manage them at a glance

UAT 5:

Given: a student is viewing my menu page When: the page loads Then: no availability toggle or "Mark as Sold Out / Available" controls are rendered on the student-facing view and students cannot change item availability

2. Student Views Real-Time Item Availability (2 Story points)

As a student, I want to see which menu items are currently available or sold out so that I can make ordering decisions without attempting to add unavailable items.

UAT 1:

Given: I am a logged-in student browsing a vendor's menu and an item is marked as available

When: I view that item Then: the "Add to Order" button is active and I can add the item to my order

UAT 2:

Given: I am a logged-in student browsing a vendor's menu and one or more items are marked as sold out

When: I view the menu Then: sold-out items are visually distinguished (e.g. greyed out with a "Sold Out" label) and the "Add to Order" button is disabled or hidden for those items

UAT 3:

Given: I am a logged-in student, and a menu item is marked as sold out When: I attempt to add that item to my order (e.g. by interacting with the disabled button or via any other means) Then: the item is not added to my order, and I see a message stating the item is currently unavailable

UAT 4:

Given: I am a logged-in student viewing a vendor's menu When: the vendor changes an item's availability status while I am browsing Then: the updated availability is reflected when I load or refresh the menu page, so I am never shown stale information

UAT 5:

Given: I am a logged-in student browsing a vendor's menu and the vendor has marked every item as sold out When: I view the menu page Then: all items are shown in a sold-out state, and a message is displayed informing me that no items are currently available from this vendor

3. Vendor Tags Menu Items with Allergens Dietary Information (5 Story points)

As a vendor, I want to tag each menu item with standardised allergen and dietary labels so that students with dietary requirements can make safe and informed ordering decisions.

UAT 1:

Given: I am a logged-in vendor adding or editing a menu item When: I reach the allergen and dietary section of the item form Then: I am presented with a standardised list of dietary labels (e.g. Halal, Vegan, Vegetarian, Nut-Free, Gluten-Free, Dairy-Free) sourced from the integrated SA/international dietary dataset, and I can select one or more that apply to the item

UAT 2:

Given: I am a logged-in vendor adding or editing a menu item When: I reach the allergen section of the item form Then: I can select applicable allergen warnings (e.g. Contains Nuts, Contains Gluten, Contains Dairy, Contains Eggs, Contains Soy) from the standardised allergen list and they are saved against the item in the database

UAT 3:

Given: I am a logged-in vendor and I have saved allergen and dietary tags on a menu item When: I view that item on my menu grid Then: the saved tags are displayed on the item card so I can verify the information is correct

UAT 4:

Given: I am a logged-in vendor and a menu item already has allergen or dietary tags assigned When: I click "Edit" on that item, update the tags, and click "Save changes" Then: the updated tags are reflected on the item immediately and saved correctly in the database, replacing the previous values

UAT 5:

Given: I am a logged-in vendor adding a menu item and I am unsure of or do not need to specify allergen information When: I save the item without selecting any tags Then: the item is saved successfully and displays a neutral indicator (e.g. "No allergen info provided") so students are aware that information has not been declared rather than assuming the item is allergen-free

4. Student Filters and Views Allergen s Dietary Information (3 Story points)

As a student with dietary requirements or allergies, I want to see allergen and dietary labels on menu items and filter by them so that I can order safely and confidently.

UAT 1:

Given: I am a logged-in student browsing a vendor's menu and one or more items have allergen or dietary tags assigned When: I view the menu Then: each item displays its dietary labels (e.g. Halal, Vegan) and allergen warnings (e.g. Contains Nuts) clearly on the item card using standardised icons or text badges

UAT 2:

Given: I am a logged-in student browsing a vendor's menu When: I apply a dietary filter (e.g. "Halal only" or "Vegan only") Then: only items matching that dietary label are displayed and all non-matching items are hidden, with a count of filtered results shown

UAT 3:

Given: I am a logged-in student viewing a menu item that has no allergen or dietary tags declared by the vendor When: I view that item Then: the item displays a clear "No allergen info provided" indicator so I know the absence of tags is not a guarantee the item is allergen-free

UAT 4:

Given: I am a logged-in student browsing a vendor's menu When: I click on a menu item to view its detail Then: the item detail view shows the full list of dietary labels and allergen warnings in a dedicated section, sourced from the standardised dataset, so I can make a fully informed decision before ordering

UAT 5:

Given: I am a logged-in student browsing a vendor's menu and I apply a dietary filter When: no menu items match the selected filter Then: an empty state message is displayed informing me that no items currently match my dietary preference, and I am given the option to clear the filter

5. Analytics Dashboard (13 Story points)

As an admin, I want to view analytics reports on the platform so that I can make informed decisions about vendors, students and ordering patterns.

UAT 1:

Given I am logged in as an admin and I navigate to the Analytics page, when the page loads and there are completed orders in the database, then a line chart showing total sales grouped by date is displayed with labelled X and Y axes.

UAT 2:

Given I am logged in as an admin and I navigate to the Analytics page, when the page loads and there are orders from multiple vendors, then a bar chart showing total sales per vendor is displayed with each vendor clearly labelled on the X axis.

UAT 3:

Given I am logged in as an admin and I navigate to the Analytics page, when the page loads and there are orders in the database, then a bar chart showing the number of orders placed per hour of the day is displayed so the admin can identify the busiest times.

UAT 4:

Given I am logged in as an admin and I navigate to the Analytics page, when the page loads and there are orders with items in the database, then a horizontal bar chart showing the top 10 most ordered menu items is displayed ranked from most to least popular.

UAT 5:

Given I am logged in as an admin and I am viewing any analytics chart, when I click the Export CSV button on any chart, then a CSV file is downloaded to my device containing the data shown in that chart.

UAT 6:

Given I am logged in as an admin and there are no orders in the database, when I navigate to the Analytics page, then each chart displays a clear message saying no data is available instead of showing an empty or broken chart.

6. Vendor Views Personal Overview Dashboard (8 Story points)

As a vendor, I want to view a personalised overview of my shop's activity so that I can monitor my performance and stay on top of my orders at a glance.

UAT 1:

Given I am logged in as a vendor and I have at least one completed order, when I navigate to my overview page, then summary cards are displayed showing my total revenue, active orders, total menu items, and average rating.

UAT 2:

Given I am logged in as a vendor and I have completed orders with multiple menu items, when I navigate to my overview page, then a top sellers list is displayed showing my menu items ranked by order frequency.

UAT 3:

Given I am logged in as a vendor and I have placed orders, when I navigate to my overview page, then a list of my most recent orders is displayed showing the order ID, item name, status, and amount.

UAT 4:

Given I am logged in as a vendor and I have orders with varying statuses, when I navigate to my overview page, then a breakdown of orders by status is displayed (e.g. Pending, Paid, Ready, Collected, Cancelled) with counts for each.

UAT 5:

Given I am logged in as a vendor viewing my overview page, when I select a time filter (Today, This Week, This Month, All Time), then all summary cards and charts update to reflect only data within the selected period without a page refresh.

UAT 6:

Given I am logged in as a vendor, when I navigate to my overview page, then a sold-out items section is displayed alongside a latest reviews section showing recent student ratings and comments.

UAT 7:

Given I am logged in as a vendor and I have no completed orders, when I navigate to my overview page, then each section displays a clear message indicating no data is available rather than a broken or empty component.

UAT 8:

Given I am logged in as a vendor and other vendors exist on the platform, when I view my overview page, then only data from my own orders and menu items is displayed and no other vendor's data appears anywhere on the page.

7. Student Views Personal Activity Overview (5 Story points)

As a student, I want to see a summary of my ordering activity so that I can track my spending, monitor active orders, and discover my ordering habits on the platform.

UAT 1:

Given I am a logged-in student with at least one completed order, when I navigate to my overview page, then summary cards are displayed showing my total orders, total spent, average order value, and number of active orders.

UAT 2:

Given I am a logged-in student and I have placed orders with one or more vendors, when I navigate to my overview page, then my most frequently ordered from vendor is displayed with the number of orders and total amount spent with them.

UAT 3:

Given I am a logged-in student with multiple completed orders, when I navigate to my overview page, then a ranked list of my most ordered menu items is displayed from highest to lowest frequency.

UAT 4:

Given I am a logged-in student and I have orders with varying statuses, when I navigate to my overview page, then a donut chart or summary is displayed showing my orders broken down by status (e.g. Pending, Collected, Cancelled).

UAT 5:

Given I am a logged-in student with at least one order, when I navigate to my overview page, then a list of recent orders is displayed showing the vendor name, date, amount, and status.

UAT 6:

Given I am a logged-in student who has not placed any orders, when I navigate to my overview page, then a clear empty state message is displayed informing me that no data is available yet and prompting me to place my first order.

UAT 7:

Given I am a logged-in student and other students exist on the platform, when I view my overview page, then only my own order history and spend data is displayed and no other student's information is accessible.

8. Vendor Appeal Management: Admin Review Portal (8 Story points)

As an Admin, I want to review corrective action submissions (appeals) from suspended vendors, so that I can approve or reject the appeal with clear feedback, and the system can update the vendor's status accordingly and notify them by email.

UAT 1:

Given a vendor submits a corrective action or appeal When the appeal is successfully submitted Then the system sends an email notification to the admin and the notification indicates that a new vendor appeal is awaiting review

UAT 2:

Given there is a vendor appeal with status Pending Review When the admin opens the appeal management page Then the admin can view the vendor's appeal details and the vendor's current status is shown as Suspended

UAT 3:

Given a vendor appeal is pending When the admin approves the appeal and submits feedback Then the vendor's status is updated to Active and the appeal status is set to Approved and the system sends an email to the vendor confirming reactivation with feedback

UAT 4:

Given a vendor appeal is pending When the admin rejects the appeal and provides feedback Then the vendor's status remains Suspended and the appeal status is set to Rejected and the system sends an email to the vendor explaining the rejection and next steps

9. Suspended Vendor: Corrective Actions Appeal Submission (5 Story points)

As a Suspended Vendor, I want to submit a corrective action or appeal explaining how I've resolved the issue, so that an admin can review my submission, and I can receive email notifications when my account status changes or a decision is made.

UAT 1:

Given the vendor account status is Suspended When the vendor attempts to access a protected vendor page Then the system displays an alert informing the vendor that their account is suspended and the alert provides an option to submit an appeal

UAT 2:

Given the vendor account is Suspended and the vendor is viewing the suspension alert When the vendor submits a corrective action or appeal explanation Then the appeal is successfully saved in the system and the appeal status is set to Pending

UAT 3:

Given a vendor has successfully submitted an appeal When the submission is completed Then the system sends a confirmation email to the vendor and the email confirms that the appeal has been received and is under review

TASKS

1. Research and Integrate a publicly available data resource to include allergen and dietary information
2. Implement overview pages for data analytics
3. Implement an exporting feature for data analytics
4. Implement the Sold/Availability feature for menu items
5. Implement the Suspension and Appeal submission for the vendors and admins
6. Integrate email services for the suspension/appeal
7. Fix bugs with the URLs

SA Data Integration

Data Source: South African Government Gazette No. 32975 — Regulation R146 of 1 March 2010, *Regulations Relating to the Labelling and Advertising of Foodstuffs*, Department of Health.

URL: https://www.gov.za/sites/default/files/gcis_document/201409/32975146.pdf

Justification: Allergen and dietary tagging on the platform is standardised using the common allergen list defined in South African Regulation R146 (Government Gazette No. 32975, 1 March 2010), issued under the Foodstuffs, Cosmetics and Disinfectants

Act 54 of 1972. This source was selected because it represents the authoritative, government-mandated classification of allergens applicable to all food sold in South Africa. Using this standard ensures consistency across vendors, eliminates free-text ambiguity, and enables reliable allergen-based analytics across the platform.

Halal Source: South African National Halaal Authority (SANHA) – sanha.org.za

Justification: South Africa has no government legislation defining halal food standards. SANHA is the nationally and internationally recognised halal certification authority in South Africa, operating under Islamic Shari'ah dietary law. We use SANHA's definition of halal as the basis for the halal dietary tag on our platform.
